

WALL SHUTTERING LINE

HEAVY FORMWORK LINE

WALL SYSTEM

The structure and wide use of the heavy shuttering line is similar to the Wood-Metal one.

The main difference is that the complete form is made of steel.

It consists of a metallic frame, and a 0,3 cm thickness plate welded to the frame, that guarantees a concrete pressure resistance of 60 kN/m² obtaining high quality face wall finishes.

It is fully compatible with the Wood-Metal line forms and with all its complements and accessories.

Column by drilling

COLUMN SYSTEM

It is also possible to build columns with the Heavy Line, by using the specific square designed for that use, under the same conditions and sizes than the Wood-Metal line system.

It is possible to manufacture the frame of this line prepared with several holes in order to allow using it with a special fitting for closing the plates and getting columns (identical sizes that the Wood-Metal line ones).
