

WALL SHUTTERING LINE

WOOD-METAL LINE

WALL SYSTEM

The Maquiobras COMBI System has been created based on the latest shuttering trends. Each form consists on a metallic framework and a 1,8 cm thick plywood board covered with a completely sealed phenolic film.

The joint of the different elements that compose the shuttering, makes possible a really fast formwork assembly by clamp (very short forming times), and generates high concrete pressure resistance (70 kN/m²).

This system allows unlimited combination possibilities between its elements and accessories, and permits a large number of uses, always depending on the plywood board proper utilization, which is very easy to clean and keep.

The high number of complements facilitates the placement of the formwork, from small plugs for filling the holes to the big wall form supporting frames (available up to 800 cm high).

This is a shuttering created to satisfy all the construction needs and requests.

COLUMN SYSTEM

With the same formwork system it's possible to build columns in two different ways: either by drilling the plywood board or by using special column frames, resulting from these two methods columns with sizes from 20 cm to 85 cm (always multiple of 5 sizes).
